INTRODUCTION

Description of the project

Current situation of the state of the question and of the subject itself for which the project is planned Based on references.

The SmartArt project has been designed following the assumptions of significant learning (Ausubel, 1968) and constructivist methodologand (Vandgotskand, 1962; Piaget 1975). In recent decades these methodologies have been included in Project-Based Learning (PBL) or Task-Based Learning (TBA) experiences (Kirschner, Sweller, and Clark, 2006). This tandpe of teaching aims, through the resolution of practical situations, to develop a significant and personalized learning (Sáiz-Manzanares, García-Osorio, Díez-Pastor, and Martín-Antón, 2019). Furthermore, in recent andears, technological progress applied to learning [Advanced Learning Technologies (ALT)] has facilitated the use of PBL or TBA in interactive platforms [Learning Management Sandstem (LMS)] and the inclusion of Smart Tutoring. These resources promote the sandstematic guidance of the learner, among them the avatars that facilitate Self-Regulated Learning (SRL) and process-oriented feedback (Hattie, 2013). All of which increases the learner's motivation (Azevedo, 2005; Zimmerman and Moandlan, 2009). In addition, the use of avatars, together with gamification techniques, increases the use of metacognitive strategies and motivation (Zimmerman and Moandlan, 2009).

In short, the use of these methodological and technological resources facilitates access to education for different people, both in formal and non-formal education (Sáiz-Manzanares, Marticorena-Sánchez, and Garcia-Osorio, 2020), with the ultimate aim of improving social inclusion and sustainable education (Sáiz-Manzanares, Rodríguez-Diez, Marticorena-Sánchez, Zaparaín, and Cerezo, 2020).

Detailed description of the project and the objectives to be achieved

In response to the research indicated in the justification, a project was drawn up aimed at developing intelligent classrooms or Smart Tutoring for learning Art History. The project "Self-Regulated Learning in SmartArt" (SmartArt-2019-1-ES01-KA204-065615) was selected by the European Union in the 2019-KA204 call for proposals. SmartArt focuses on the development of materials for the learning of Art History, the design of which is based on the use of pedagogical techniques based on Bloom's taxonomy, serious games techniques and psychological techniques based on SRL. All of them implement virtual learning spaces or Virtual Learning Environment (VLE).

The SmartArt project aims to design an intelligent learning classroom for learning Art History based on the use of SRL and multimedia resources that promote personalized learning (the classroom will be open access and can be used from the project's website. This classroom will be designed in principle for the learning of adults who carry out non-regulated training activities. However, it will later be adapted to the learning of students from other stages of the education system (Primary Education, Secondary Education, Baccalaureate and University).

Project objectives: General objectives. Justification of the interest and viability of the project

The general objectives are 1) the design of an intelligent learning environment in the field of Art History based on self-regulated learning design and the use of multimedia resources to achieve personalized learning. 2) To increase the motivation towards learning Art History, especially in adults, from the inclusion of digitization tools and motivating learning techniques as it happens with gamification and the inclusion of avatars. 3) To adapt the materials for use in other stages of the educational system such as Primary Education, Secondary Education, High School and University.

The interest in the project is high, as it is a young research field that is just starting up as noted in the introduction. Furthermore, it focuses on a subject, Art History, which is widely accepted by the target segment of the population, that of adults who, in turn, will participate in a learning experience in virtual environments adapted to their needs. The viability of the project has been proven as it has been selected in the Erasmus+ Adult Education 2019 call. Nowadays, the project is starting its second year of development, and the progress made to date can be consulted in the results section.

METHODOLOGY

Description of the material and methodology that will guide learning. Scheduled activities

The materials developed in the SmartArt project are three teaching units about the development of monasteries in Europe. These units include the use of systematic feedback to the student on the degree of achievement of conceptual and procedural contents. This is achieved through the self-evaluation materials that are included in each of the units, consisting of a crossword puzzle of increasing difficulty, and a final activity that contemplates two levels (initial and advanced). Likewise, the resources used to apply the feedback are based on the use of ALT and avatars that enhance the development of the SRL through a Smart Tutoring system included in the VLE (Hattie, 2013; Hattie and Timperland, 2007). This system provides accurate assessment criteria to students on what is considered successful learning. In addition, the use of SRL ensures that learning activities are graded in a hierarchical order of difficulty, increasing learner's motivation to continue learning. The units also include rubrics that help both students and teachers, to evaluate the degree of learning (Sáiz-Manzanares, Cuesta, Alegre, and Peñacoba, 2017). The working method is explained in the first intellectual product (Zaparaín-Andáñez, Sáiz-Manzanares, Andrés-López, and Rodríguez-Arribas, 2020) which is available on the website in Spanish, English and Portuguese.

Likewise, the SmartArt project has a positive report from the Bioethics Committee of the University of Burgos IR 27/2019. In addition, each participant must sign an informed commitment. This document explains the objectives, the phases of the project, the procedure for anonymisation, data processing and custody, as well as their right to stop participating in that project, if they so wish. This information is contained in all surveys or project activities. The final objective is to comply with Spanish and European data protection regulations.

Justification of the methodology from the point of view of the suitability for the objectives to be achieved

As mentioned above, in the last decade, the use of LMSs has been very effective in the teaching-learning process, especially in adults (Cerezo, Sánchez-Santillan, Paule-Ruiz, and Nuñez, 2016). LMSs allow the use of multimedia resources that facilitate the development of the teaching-learning process (Sáiz-Manzanares, García-Osorio, and Díez-Pastor, 2019). In turn, these resources guide the SRL and allow the regular learner to regulate his/her own learning in a personalized way (Sáiz-Manzanares, García-Osorio, Díez-Pastor, Martín-Antón, 2019), since they include planning, monitoring, control and regulation, all of which increases the learner's motivation (Sáiz-Manzanares, Marticorena-Sánchez, García-Osorio, and

Díez-Pastor, 2017). Manand of the process-oriented feedback processes and procedures can be included in the LMS, (Sáiz-Manzanares, Marticorena-Sánchez, García-Osorio, and Díez-Pastor, 2017), including the use of rubrics (Sáiz-Manzanares, Cuesta, Alegre, and Peñacoba, 2017). Automating the use of these resources generates an intelligent tutoring sandstem, Smart Tutoring or MetaTutoring which has proven to be effective in the development of metacognitive self-regulation (Azevedo et al., 2013; Cloude, Taub, Lester, and Azevedo, 2019; Taub and Azevedo, 2019). In addition, the SmartArt project includes resources for checking one’s own learning (self-assessment processes) including questionnaires and crossword puzzles that include automated feedback on answers (Sáiz-Manzanares, García-Osorio, and Díez-Pastor, 2019).

Adaptation of materials and methodologand to each tandpe of activitand

The three thematic units follow a methodological structure set out in table 1.

Table 1. Design of learning activities (adapted from Sáiz-Manzanares, Escolar-Llamazares, and Arnaiz-González, 2020 p. 3)

Designing activities	Design module	What to evaluate
What	What do I want to teach?	Learning goals
	What skills do I want to develop in the trainees?	Knowledge design
How	Designing learning tasks	Test and quizzes to check learning achievements
Who	Who are the learning tasks aimed at? What’s the learner like?	Knowing the previous knowledge
When and Where	Timeline of the development of learning tasks	Sequential graduation of the difficulty of learning task
	Study of learning behaviours in students	Process-oriented feedback planning Product-oriented feedback planning

Table 2. Questionnaire on the usabilitand of materials and the ad hoc developed VLE

Questions	Rating Scales				
1. I found the materials (1= bad – 5= very good)	1	2	3	4	5
2. I found the materials (1= phobic – 5= attractive)	1	2	3	4	5
3. I found the materials (1= conventional – 5= new)	1	2	3	4	5
4. I found games and activities (1= boring – 5= interesting)	1	2	3	4	5
5. The work on the teaching units seemed to me (1=slow -5= fast)	1	2	3	4	5
6. I found the platform easy to use (1=nothing-5= very much)	1	2	3	4	5

Table 2. Questionnaire on the usability of materials and the ad hoc developed VLE (continuación)

Questions	Rating Scales
7. Would you recommend testing the platform and materials, if so Why?	
8. What elements would you include in the platform and materials?	
9. What elements would you eliminate from the platform and materials?	

Available resources (ICT, Center, Department, Others...) and their adaptation to the project

The resources used are a VLE developed ad hoc in which materials for learning Art Historand have been included. These materials have been developed with a methodology based on SRL that is implemented through the figure of an avatar in serious games tasks, an example can be found in the results section.

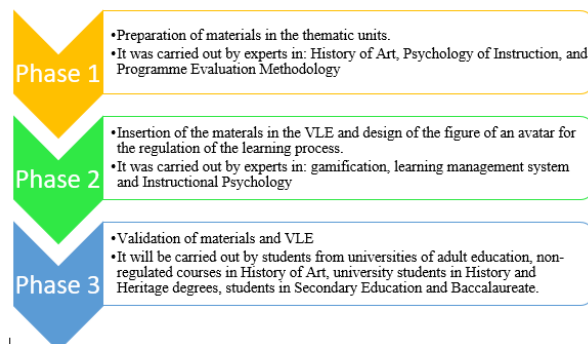

Indicators and evaluation mode

The evaluation of the usability of the materials and the VLE will be contrasted through an ad hoc opinion questionnaire containing 6 closed-ended questions and 3 open-ended questions. This questionnaire will be applied once the user has used the materials and resources of the VLE in the different thematic units on Art Historand content (see Table 2).

Organisation and planning of the project

The organisation and planning of the project consists of three phases which can be seen in figure 1.

Figure 1. Organization and planning of the project

RESULTS

Aspects evaluated or to be evaluated after completion

The usability and effectiveness of materials and VLE will be evaluated through the opinion questionnaire on the usability of the materials and the ad hoc developed VLE (see Table 2). The project is currently in this phase of implementation of the VLE.

Description of the evaluations

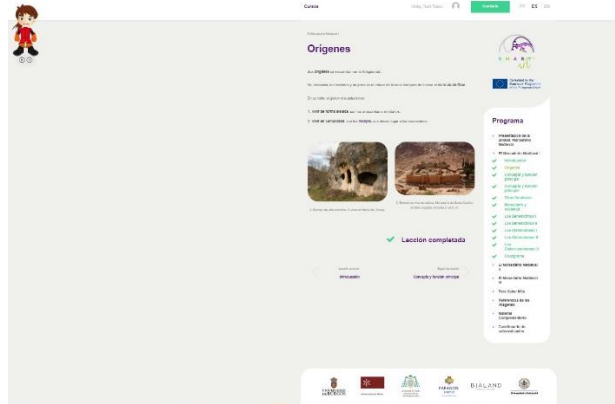

Data will be collected on the usability and effectiveness of materials and VLE in different student groups: adult education universities, non-regulated art history courses, university students in History and Heritage degrees, Secondary Education and Baccalaureate. Subsequently, it will be checked whether there are significant differences in satisfaction between them. Finally, the appropriate changes will be applied to the materials and the VLE in order to improve both.

Below are examples of the materials implemented in the VLE (see Figure 2), the use of an avatar for the SRL (see Figure 3), and the gamification procedure.

Figure 2. Materials for learning art history in Unit 3.1. Claustral topography III

The screenshot shows a VLE interface for a course titled 'Topografía Claustral III'. At the top, there is a navigation bar with 'Curso', 'Inicio', 'Test', 'Favor', and a 'Compartir' button. Below the navigation bar, the course title 'Topografía Claustral III' is displayed, along with a small logo for 'SHABIT art' and a badge indicating it is 'Certified by the Spanish Programme for Quality Improvement'. The main content area features two large images: the top one shows a perspective view of a long, vaulted stone corridor with arches, and the bottom one shows a similar corridor filled with wooden barrels. To the right of the images is a 'Programa' (Program) list with various topics and their completion status. At the bottom of the page, there is a green button that says 'Ver la unidad como completa'.

Figure 3. Learning regulation (SRL) through the figure of an avatar

DISCUSSION/CONCLUSIONS

What is new in its implementation?

The product's innovation lies in the methodology and technology used, i.e. in the development of an intelligent learning classroom in the field of Art History. This classroom includes self-regulated learning design, multimedia resources for intelligent tutoring and procedures for continuous and systematic assessment of the learning process. All this is expected to increase motivation and learning achievement. The Project is especially relevant in the current situation of health crisis and COVID-19 since this type of intelligent classrooms are going to allow to reach a greater number of citizens within non regulated and also regulated training programmes favoring the personalization of the learning proposals.

In sum, one of the main contributions of the project is the careful elaboration of the materials and the functionality and usability of the platform. This platform provides aids that allow users to adapt their learning to their own pace and level of knowledge. It also provides product- and process-oriented feedback. Another of its contributions is the figure of the avatar, which emphasizes the more complex contents and facilitates their understanding with aids based on the regulation of learning from a meta-tutoring design. Furthermore, including degrees of difficulty in the activities and tasks, it facilitates their application to other groups such as the Secondary Education, Bachelor and university environments. All this means that the SmartArt classroom has great potential for use, which promotes the generalisation and transfer of learning in an increasingly globalised society. This will facilitate its use within the partners of the project's strategic association as it is offered in three languages (Spanish, English and Portuguese) and also within the member states of the European Union and outside it as it is an open access tool. The materials and the Smart Art classroom can be accessed free of charge on the SmartArt project website

<https://www.srlsmartart.eu/> in the results section and in the link to the virtual classroom here and you can carry out a self-check of the degree of learning in different activities and evaluate both the effectiveness of the materials and the usability of the platform. The evaluation will provide feedback on the results so that decisions can be taken on the changes required from a quality process of continuous improvement.

Acknowledgements. These materials were produced as part of the "Self-Regulated Learning in SmartArt" project Erasmus+ Adult Education 2019-1-ES01-KA204-095615. This is co-financed by the European Commission and coordinated by the Universidad de Burgos.
